When Apollo 11 launched into the sky July 16, 1969, the public faced the immense mystery, by design, of three ordinary astronauts: Neil Armstrong, Buzz Aldrin and Michael Collins.

But 400,000 people worked on that mission. From the Boeing site to the Kennedy Space Center, thousands of teams collaborated to complete the first phase of the Saturn V rocket, which would hurl the Apollo 11 crew toward the moon.

The leaders of that team were self-described “Ballard guys.” And one Seattle-area scientist, Dr. James Joki, contributed to the formation of the lunar surface, and concocted gear that would keep Apollo 11 astronauts alive.
